What are the issues?

- **Is our food and water safe?** Is it free of toxins? Is it free of contaminants or pollutants? Is it free of pathogens? If we have allergic responses to certain ingredients, can we trust the labeling?
- **Is it authentic?** Are we consuming what we think we are? Are the ingredients what they say on the can or on the label?
- **How is it produced?** An increasing proportion of the population is interested in the way that food and bottled water is produced, in terms of the environment, animal welfare, and provenance. Is it fair trade or organically produced?

The production of food and water involves complex supply chains and processes. In simple terms, there is the production of crops and the rearing of animals, followed by the practices involved with sourcing, harvest and slaughter. Then there is the storage, treatment and processing, and in turn packaging and distribution. The food and water industry operates in a highly competitive, dynamic and regulated environment.

There are a series of complex issues and a range of areas where there has to be tight control to ensure that the food and water supply is safe when dealing with the mass production of food and water in urban and rural areas. Consideration also needs to be given to the retail environment in terms of storage and display. Increasingly, there is an international aspect to food and water production, as ingredients, products or parts of products, may come from several countries around the world.

So how can we be confident that our food is safe and the water we drink is clean?

Samples, products, services, management systems or personnel can be evaluated against specified requirements by laboratories, certification bodies, and inspection bodies (collectively known as conformity assessment bodies). Conformity assessment is used to check that products are fit and safe for consumption against a standard, a code of practice or regulatory requirements.

Conformity assessment therefore provides a means for preventing unsafe, unhealthy or environmentally harmful products from entering the market place. Regulators can set overall policy requirements or detailed technical requirements and rely on laboratories, inspection bodies or certification bodies to check for compliance.

What is the role of accreditation?

Accreditation is the independent evaluation of these conformity assessment bodies against recognised standards to carry out specific activities to ensure their integrity, impartiality and competence. Through the application of national and international standards, government, procurers and consumers can therefore have confidence in the calibration and test results, inspection reports and certifications provided.

Accreditation bodies are established in many countries with the primary purpose of ensuring that conformity assessment bodies are subject to oversight by an authoritative body.

Accreditation bodies, which have been evaluated by peers as competent, sign arrangements that enhance the acceptance of products and services across national borders, thereby creating a framework to support trade.

These arrangements are managed by the International Laboratory Accreditation Cooperation (ILAC), in the area of laboratory and inspection accreditation, and the International Accreditation Forum (IAF), in the fields of management systems, products, services, personnel. Both organizations, ILAC and IAF, work together and coordinate their efforts to enhance accreditation and conformity assessment worldwide.

For businesses operating in the food and water industry

Supermarket chains and food retailers are increasingly demanding that their suppliers demonstrate that their products meet food and water safety standards by requiring accredited test reports, inspection reports and certifications.

Compliance to food and water safety standards demonstrates that suppliers are meeting appropriate levels of safety, environmental performance, and animal welfare. Accreditation, and the use of accredited conformity assessment bodies, can also support business in the supply chain against potential liability claims.

International accreditation agreements provide an infrastructure that allows accredited certificates to be accepted around the world. This reduces the risk of products being rejected by international trading partners, and for the need to have products re-evaluated on entry into each country.

What benefit does accreditation provide?

For National Authorities and Regulators

Regulators can set policy requirements or detailed technical requirements and rely on accredited laboratories, inspection bodies or certification bodies to check for compliance. Regulators can therefore reduce their in-house inspectorates and specialist assessment personnel to reduce cost, or target their inspections more effectively. The use of accredited services can also moderate the need for additional legislation, as well as reducing the risk of unintended consequences. International accreditation arrangements provide Regulators with a robust and credible framework to accept accredited test results, inspection reports and certifications from overseas, with an equivalent level of confidence as if they were carried out in the local economy. Accreditation therefore provides a reliable monitoring tool to support the work of food safety and drinking water agencies.

For consumers

Consumer confidence can be gained from goods or services that are accompanied by an accredited certificate of conformity. International accreditation agreements ensure that such goods and services placed on the market, from which ever country of origin, meet standards of quality and safety.
